

# Research proposal writing workshop

Kicking off a discussion on the proposal writing process

**Peter Furu**

**Department of International Health,  
Immunology and Microbiology**

**University of Copenhagen**

KCMC, Moshi

8-12 October 2012

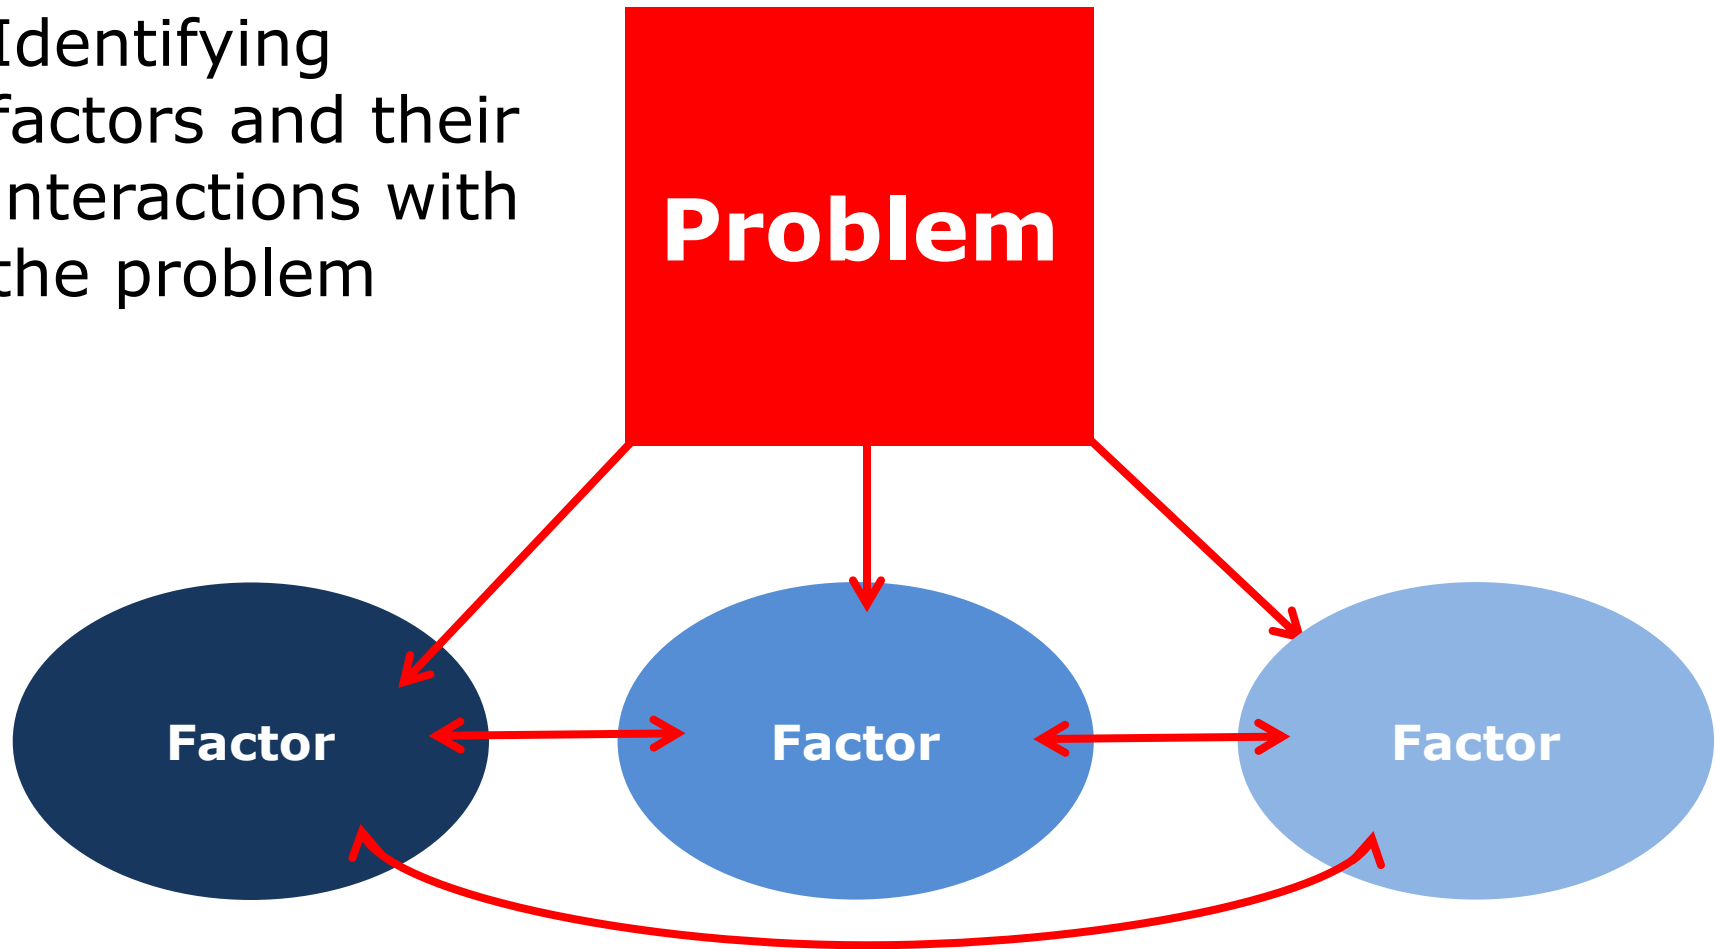

“Defining a research problem is the fuel that drives the scientific process and is the foundation of any research method and experimental design from true experiment to case study”

Shuttleworth, 2008

## Problem analysis

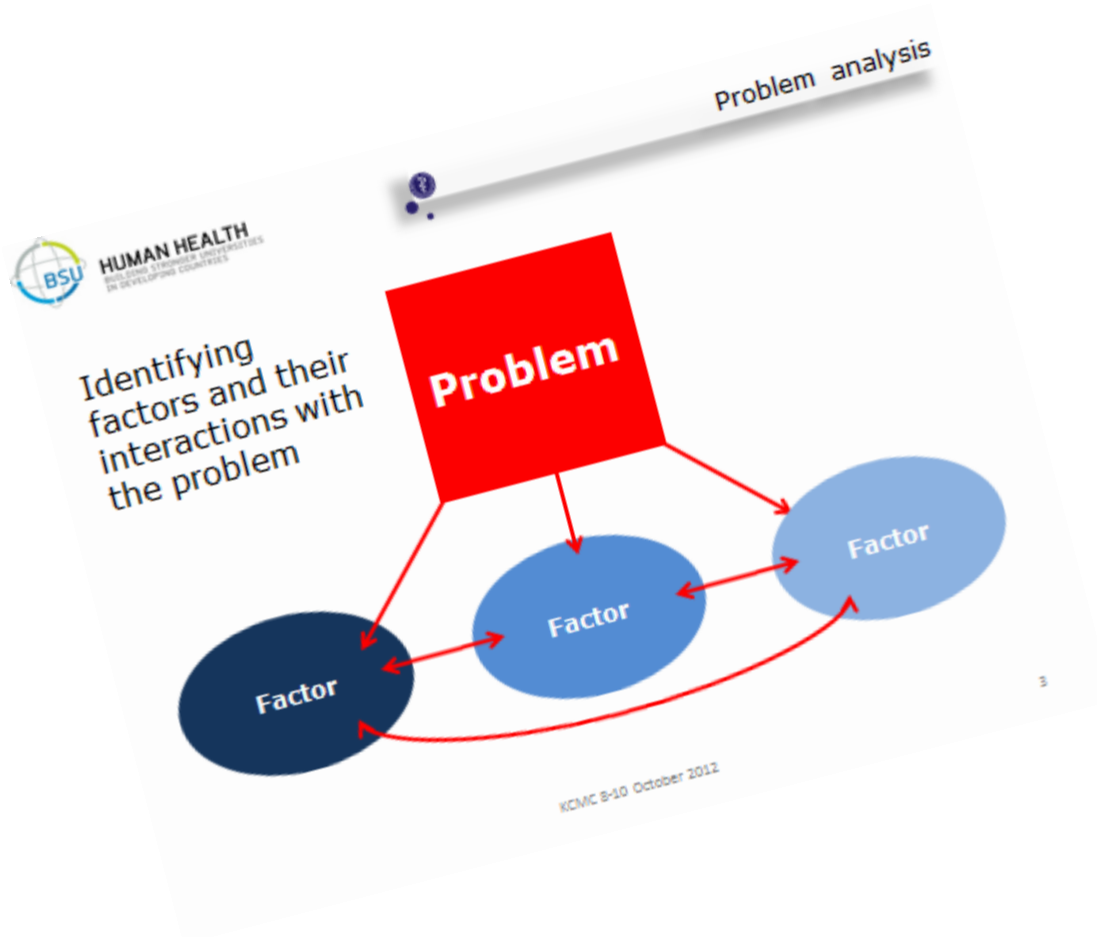

Identifying  
factors and their  
interactions with  
the problem

Before writing the proposal

Problem analysis

Stakeholder identification

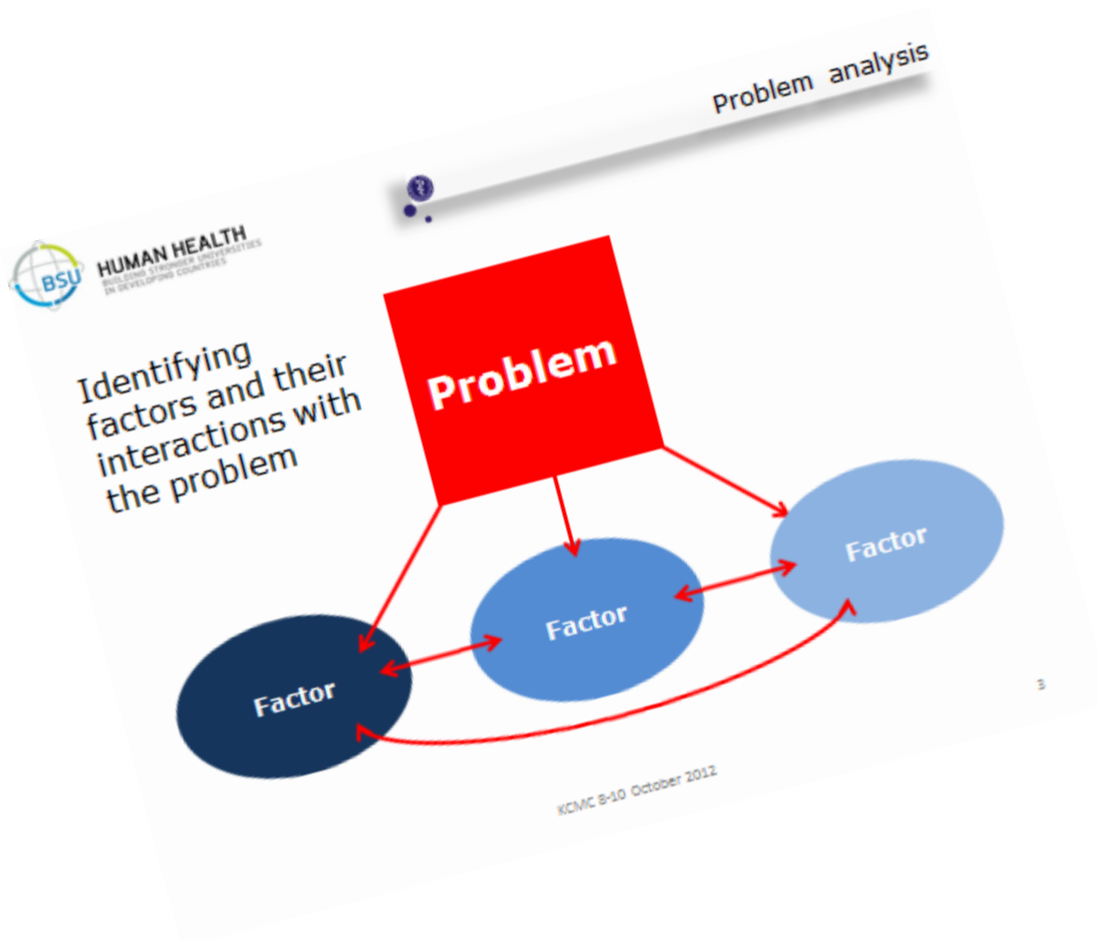

## Reflection !

Who are involved  
in problem  
identification and  
analysis ?

# Before writing the proposal

## Problem analysis

What is the problem ?

What are the factors ?

## Example of a problem

**Increased environmental  
health burden of water  
related diseases in  
Southern Africa**

## **Climate change/variability**

- Increased temperatures
- Increased rainfall
- Increased flooding

## **Environmental**

- Degradation of biodiversity
- Loss of medicinal plants
- Insufficient sanitation facilities
- Decreased air quality
- Increased vector breeding potential
- Increased environmental pollution
- Poor drainage systems
- Excessive use of agrochemicals
- Contamination of drinking water

## **Governance/institutional**

- Haphazard industrial development
- Unreliable environmental impact assessments
- Inadequate health infrastructure and capacity
- Insufficient raining of health workforce
- Weak health education
- Poor accessibility to health services
- Weak policies (health, water, environment)
- Weak waste disposal systems
- Unstable drug delivery
- Low disaster preparedness
- Lack of prior consultations/involvement
- Weak legislation and enforcement

## **Socio-economic**

- Poverty
- High illiteracy
- Gender imbalance
- Increased food shortages

## **Biological**

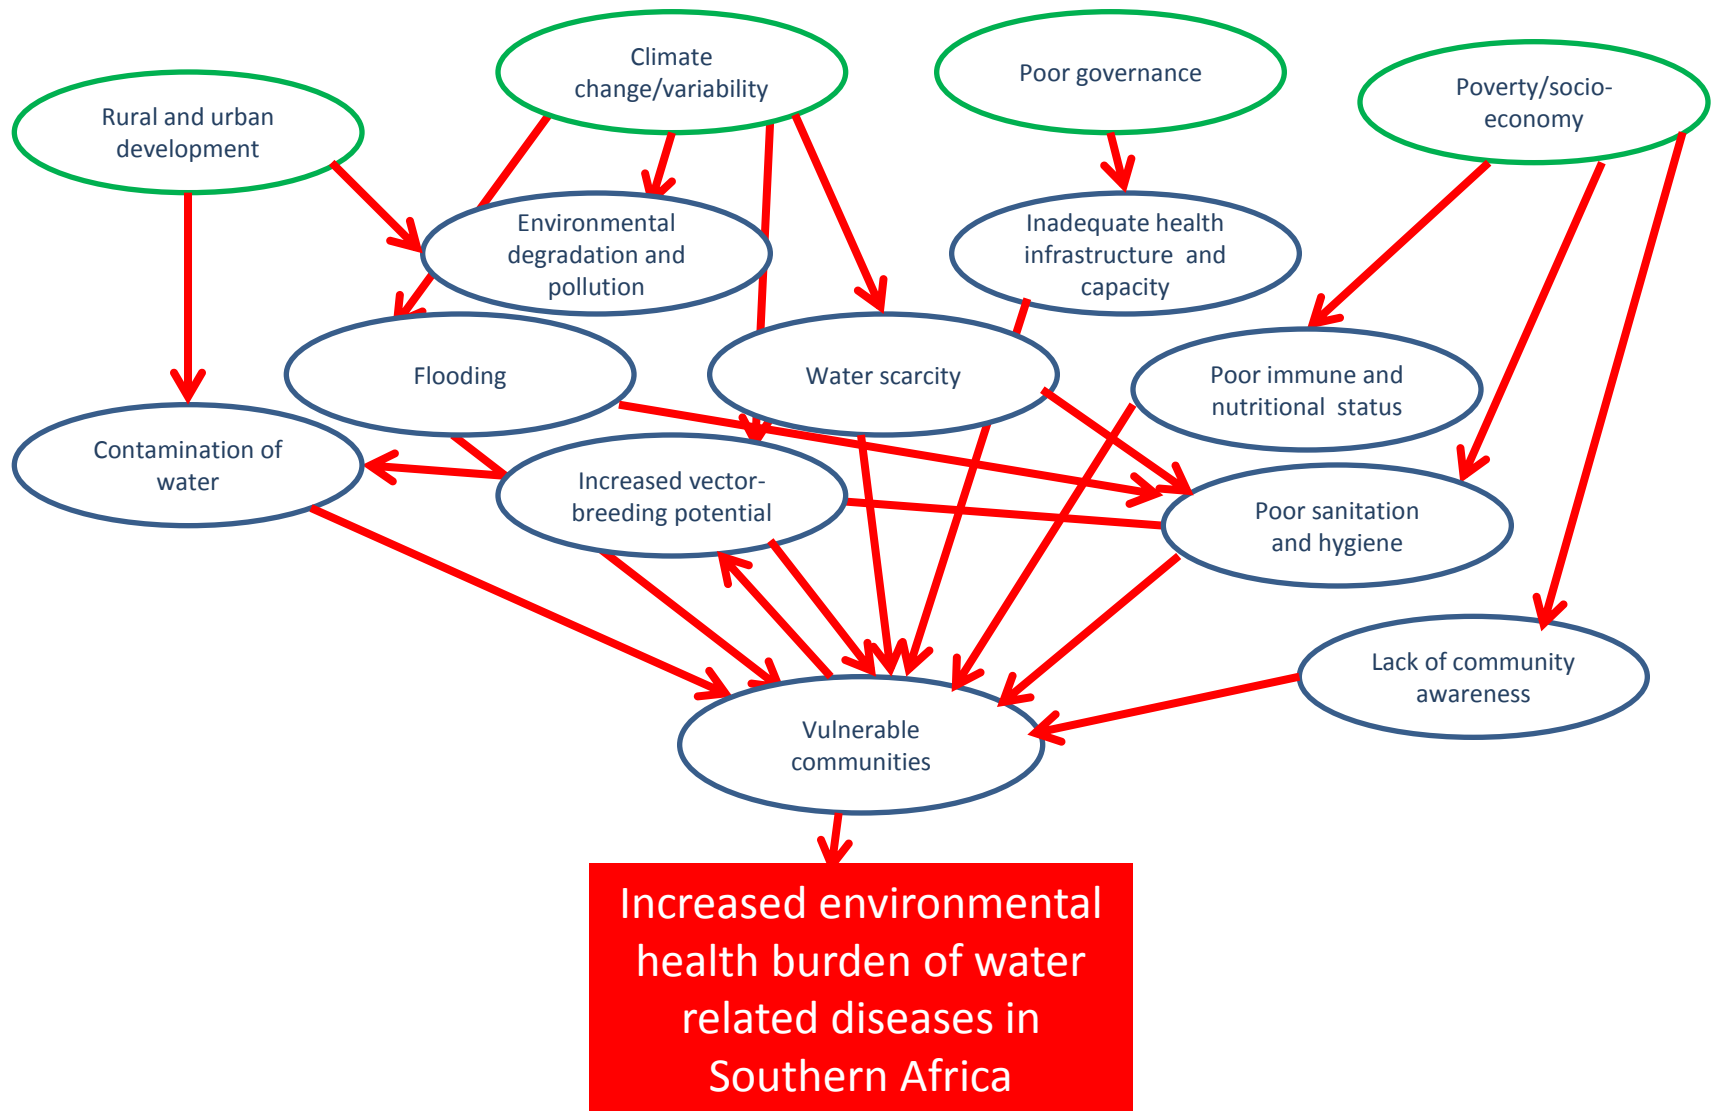

- Poor immune status
- Poor nutritional status

## **Behavioral**

- Inappropriate cultural beliefs and practices
- Poor knowledge on hygiene behaviour

# Before writing the proposal

## Conceptual framework

## Before writing the proposal Problem statement

Eventually the formulation of a **problem statement** should reflect the **context and focus** of the chosen research area and at the same time state the **significance and justification** of the project

It will provide a frame for the expected results, conclusions and possible recommendations

## Reflection !

What are then the next steps in the proposal development process ?

## One next step is:

Literature review – developing background

## **Reflection – again !**

What do you see as the main generic content and characteristics of the Background section ?

- Close link to problem statement
- Explaining the scientific and technological aspects of the research area in detail – the rationale
- Reflecting state-of-the-art – recent debate
- Demonstrating that your research will interface with what has gone before to add to the stock of knowledge in a helpful way
- Identify knowledge gaps

Writing the proposal

Background/literature review

Sources of information

## **Reflection !**

What are your sources of information for doing a proposer literature review ?

- Search strategy with key words (Mesh)
  - Peer reviewed literature – library data bases, PubMed, etc.
  - Grey literature – difficult to get
  - Review articles
- Internet based searches – WHO data bases (Hinari), Google Scholar, etc.
- Networking - conferencing

## **Then follows ?**

Translating the conceptual framework, problem statement and literature review into research questions and possibly research hypotheses

**And here hand-over to Dr Cilongola for discussions on how to develop research questions and objectives !**

**Thank you !**
